

The Future of Treated Wood is Here

And if the product name sounds familiar, that's because it is.

Wolmanized® Outdoor® wood has been known to provide long-lasting resistance to termites and fungal decay while maintaining the natural beauty of real wood. Lonza Wood Protection is the company that developed the Copper-Azole technology and introduced it to the international market more than 20 years ago.

And, now the same innovators of Copper-Azole technology have once again raised the bar by adding BARamine® technology, which further increases penetration and adds additional protection against copper-tolerant fungi.

This high-powered Copper Azole is steps ahead of other residential formulations and exceeds the requirements of industry-approved products.

BARamine® is combined with either dissolved or micronized Copper Azole to make Wolmanized® Outdoor® wood the ideal choice for decks, retaining walls, fences, picnic tables, planter boxes, walkways, sill plate and structural members. At appropriate retention levels, it can be used for above ground, ground contact, and freshwater immersion applications.

Warranty

Wolmanized® lumber is backed by a limited warranty in qualifying applications. See www.LonzaWoodProtection.com for details.

What BARamine® Technology Adds to the Wood

- Patented technology is the most effective copper azole system available
- Additional active ingredient provides
 - o Protection against a broad range of copper-tolerant fungi
 - o Improved efficacy against traditionally tested fungi
 - o Better mold protection to help maintain an attractive appearance
- Enhanced stability of preservative solutions results in a cleaner, brighter look
- Other proprietary components result in
 - o Improved preservative penetration
 - o More consistent preservative distribution
